

Comparative Study On Food Safety In The Wake Of The Mad Cow Crisis

The Mad Cow Crisis was a major food safety crisis that occurred in the United Kingdom in the 1990s. The crisis was caused by the consumption of beef from cattle that were infected with bovine spongiform encephalopathy (BSE), a fatal degenerative disease of the brain. The crisis led to a loss of consumer confidence in beef and other meat products, and had a significant impact on the global food industry.

In the wake of the Mad Cow Crisis, many countries around the world implemented new food safety measures to prevent a similar crisis from happening again. This book provides a comparative study of the different approaches taken by various countries to ensure food safety. The book examines the strengths and weaknesses of each approach, and identifies the best practices that can be adopted to prevent future food safety crises.
